

Strengthening discovery & citation in search & AI: SEO, AEO & GEO

Layered structural improvements so the work you’re already doing in SEO, content, and local can compound — earning deeper discovery and more trusted citations over time.

Five structural priorities: today, after the rebuild, and how we sustain each as an operating model.

1 Machine-readable depth can still go furtherHIGH IMPACT		
TODAY Schema and feeds are a baseline; a fuller entity graph, AI-ready index, and server-rendered critical facts would help crawlers use every signal you publish.	AFTER REBUILD - Unified Schema - Canonical AI feed - SSR for critical facts - Consistent page structure	HOW WE SUSTAIN IT - Quarterly schema audits as the site evolves - Governance: new page types get entity markup before launch, not after - AI feed refreshed on a cadence tied to content updates
Incomplete Structured Readiness	AI Authority	Schema & Feed Governance

2 Location data is fragmented and slow to fixHIGH IMPACT		
TODAY NAP and Google Business Profiles drift; emergency fixes take days; local pages carry weak “local” signals.	AFTER REBUILD - One source of truth - Fast overrides - Auto-synced listings - Stronger local pages - Wait times in later phases	HOW WE SUSTAIN IT - Standing sync cadence (monthly or triggered by store changes) so the source of truth stays authoritative - Owner for NAP exceptions — someone watches the alerts
Fragmented Local Presence	Unified Location Truth	Listings Sync & Ownership

3 Content doesn’t answer searchable questionsHIGH IMPACT		
TODAY Thin service copy, unstructured articles, and voice rules that avoid the terms people actually search.	AFTER REBUILD - Services hub and FAQ - Answer-first modules - Editorial guidelines aligned with intent, not just brand tone	HOW WE SUSTAIN IT - Prompt-gap analysis → rolling editorial queue for unanswered questions - Guidelines reviewed when Take5 adds services or enters new markets
Thin, Search-Misaligned Content	Answer-First Content	Rolling Editorial Intelligence

4 Headroom to grow in AI-assisted discoveryHIGH IMPACT		
TODAY Stronger brand and entity signals, plus a fuller off-site footprint, would help close the gap vs. competitors on conversational and “near me” queries.	AFTER REBUILD - Defined brand entity - Structured off-site program - Conversational-ready local content - Prompt audit to steer priorities	HOW WE SUSTAIN IT - Share of Model monitoring — track citations on ChatGPT / Gemini for oil-change prompts - Off-site citations like link-building: evergreen, not a one-time sprint
Underpowered Discovery Signals	Entity & Discovery Ready	Model & Off-Site Monitoring

5 We can’t prove what works, especially in AIMEDIUM IMPACT		
TODAY Analytics don’t line up; no experimentation loop; no view of AI citations or unsampled conversion paths.	AFTER REBUILD - Shared data layer - A/B testing - Share of Model tracking - BigQuery for full-funnel reporting	HOW WE SUSTAIN IT - Data layer + BigQuery as infrastructure — value compounds as more experiments run - A/B velocity (tests per quarter) as a team KPI, not a project deliverable
Measurement & AI Blind Spots	Unified Measurement Stack	Ongoing Experimentation Program
